

SAMSUNG

Guided Discovery

Benefit-first navigation to reduce decision fatigue and boost conversions

Project Overview

Samsung.com's TV and Laptop discovery experience relies heavily on technical jargon and long product lists. This academic project reimagines the experience to focus on user needs first, inspired by real-world industry challenges.

Project Overview

Scope:

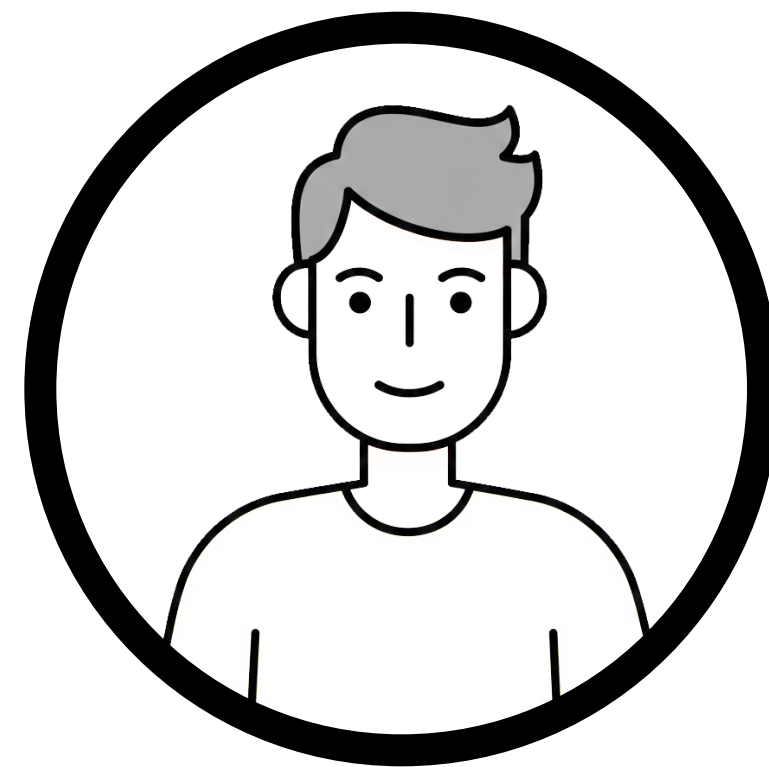

- Duration: 6 weeks (Research, Ideation, Prototyping, Testing)
- Role: Lead UX/UI Designer (end-to-end process)
- Team: Solo project with peer feedback from design program
- Goal: Create a needs-based discovery path that helps users find the right product faster and with more confidence.

Why It Matters:

- Shows how a structured UX process can address common pain points in high-tech retail.
- Demonstrates ability to translate research insights into actionable design solutions that align with brand and business goals.

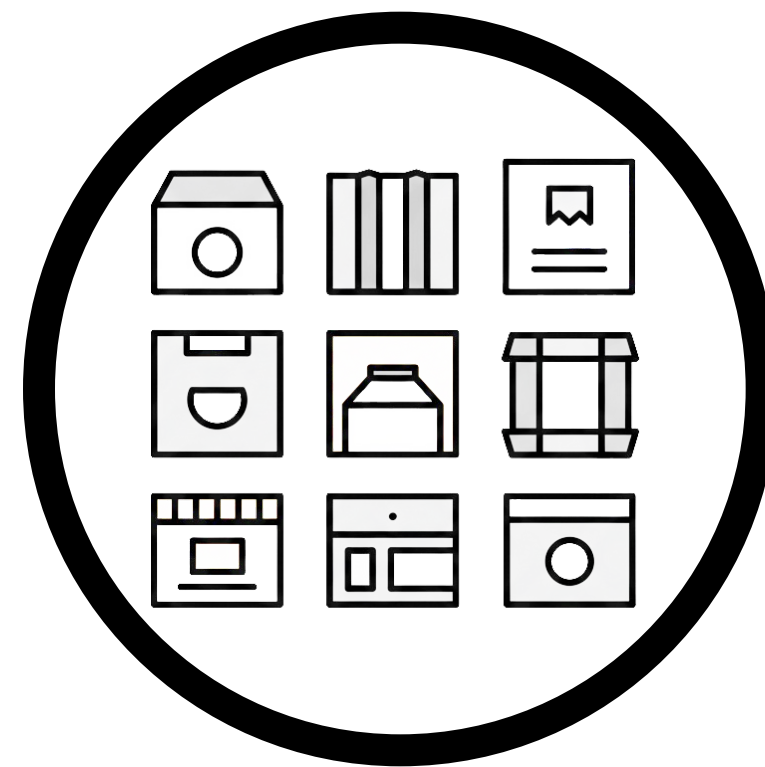

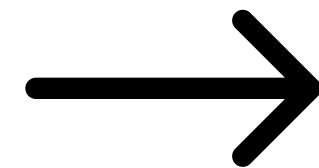

Design Principle

“Start with the shopper’s goal, not the product’s specs.”

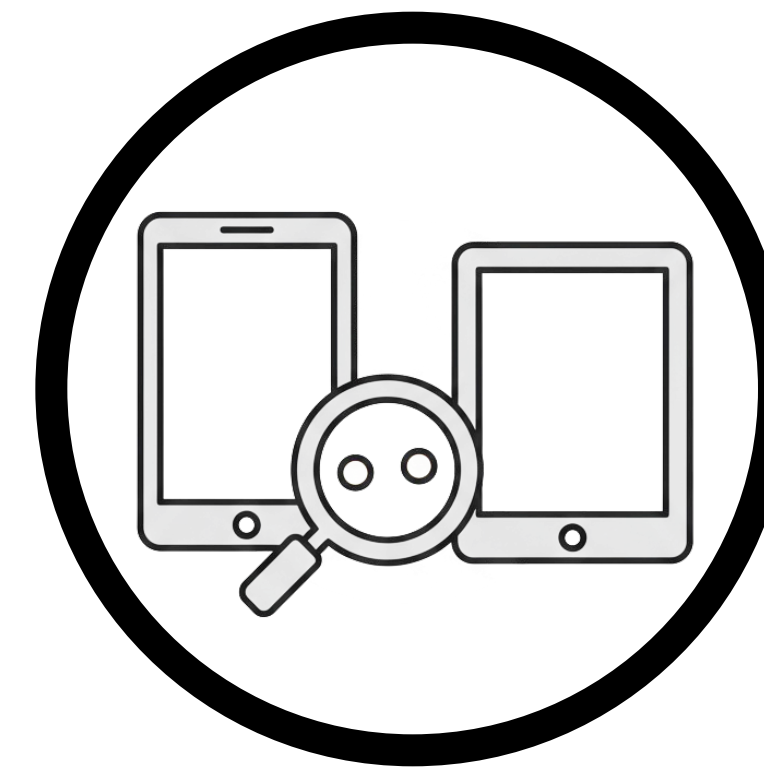

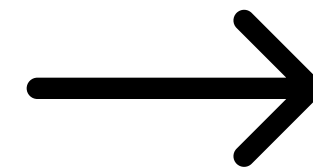

Persona / Goal

First screen needs to guide the user for who they are or what’s most important to them.

Curated Recommendations

Shows only 2–3 highly relevant models, reducing choice overload.

Tailored Comparison

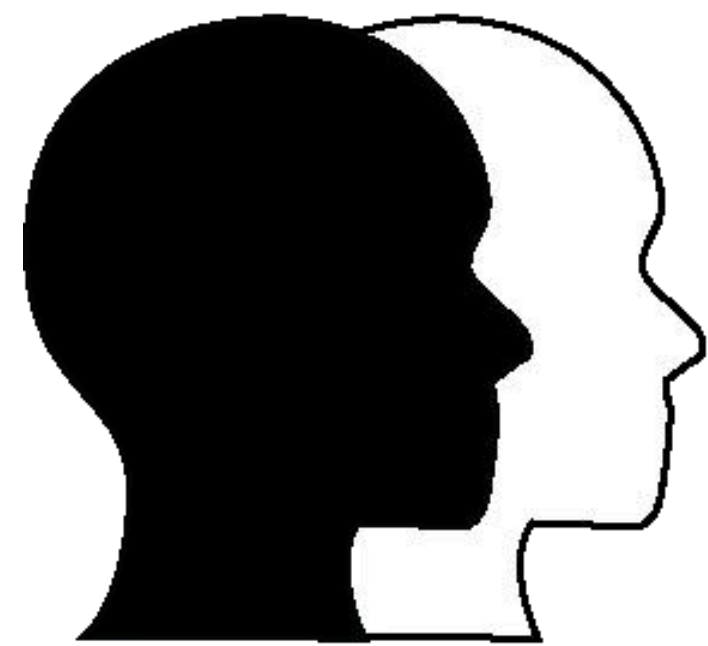

Highlights decision factors that matter most for that persona.

Contextual Upsell

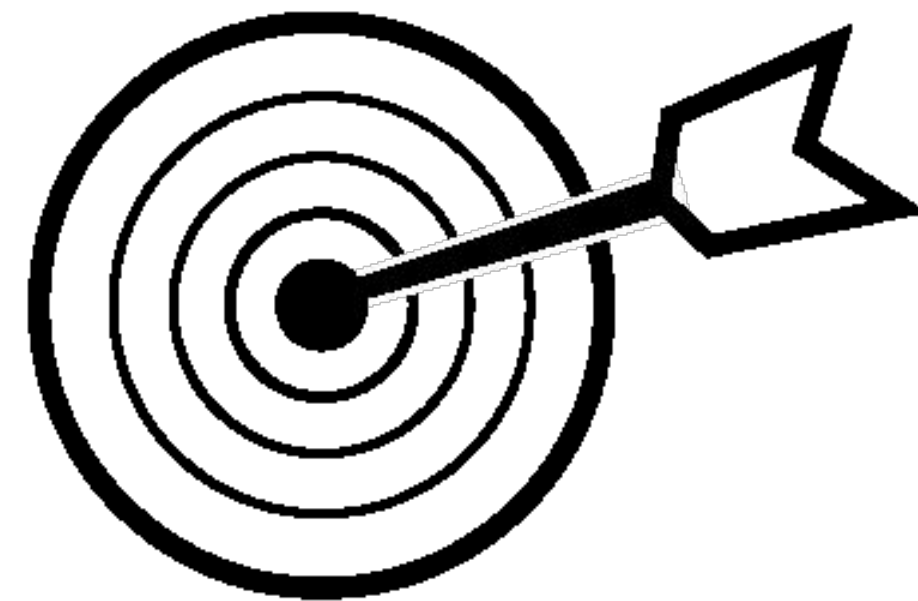

Offers the perfect accessory after the main choice, not before

Design thinking

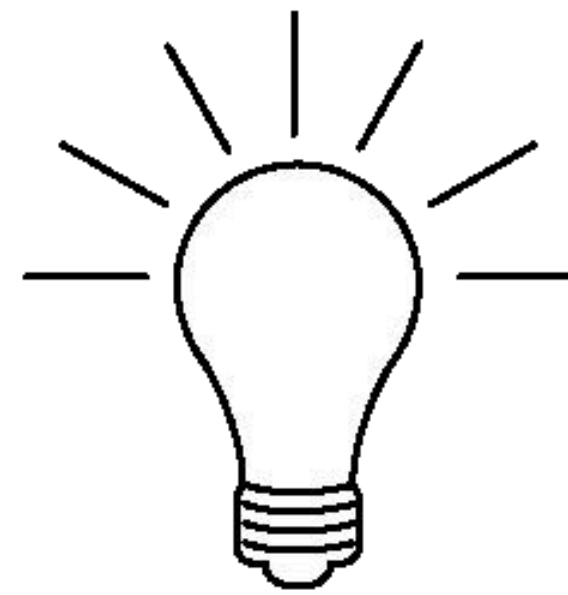

Empathize

Interviews, analytics,
benchmarking

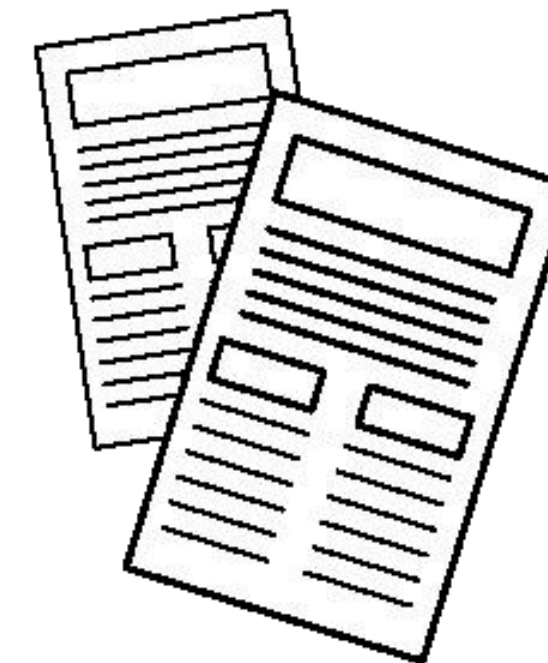

Define

Pinpointed confusion at
entry point, lack of guidance,
weak upsell timing

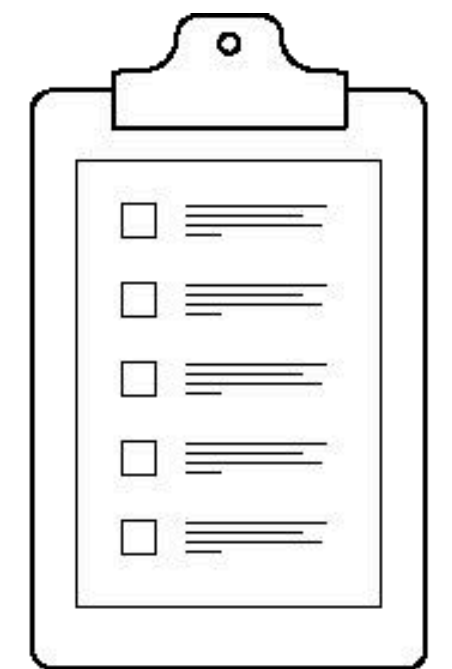

Ideate

Sketched needs-based
navigation & persona-
driven flows.

Prototype

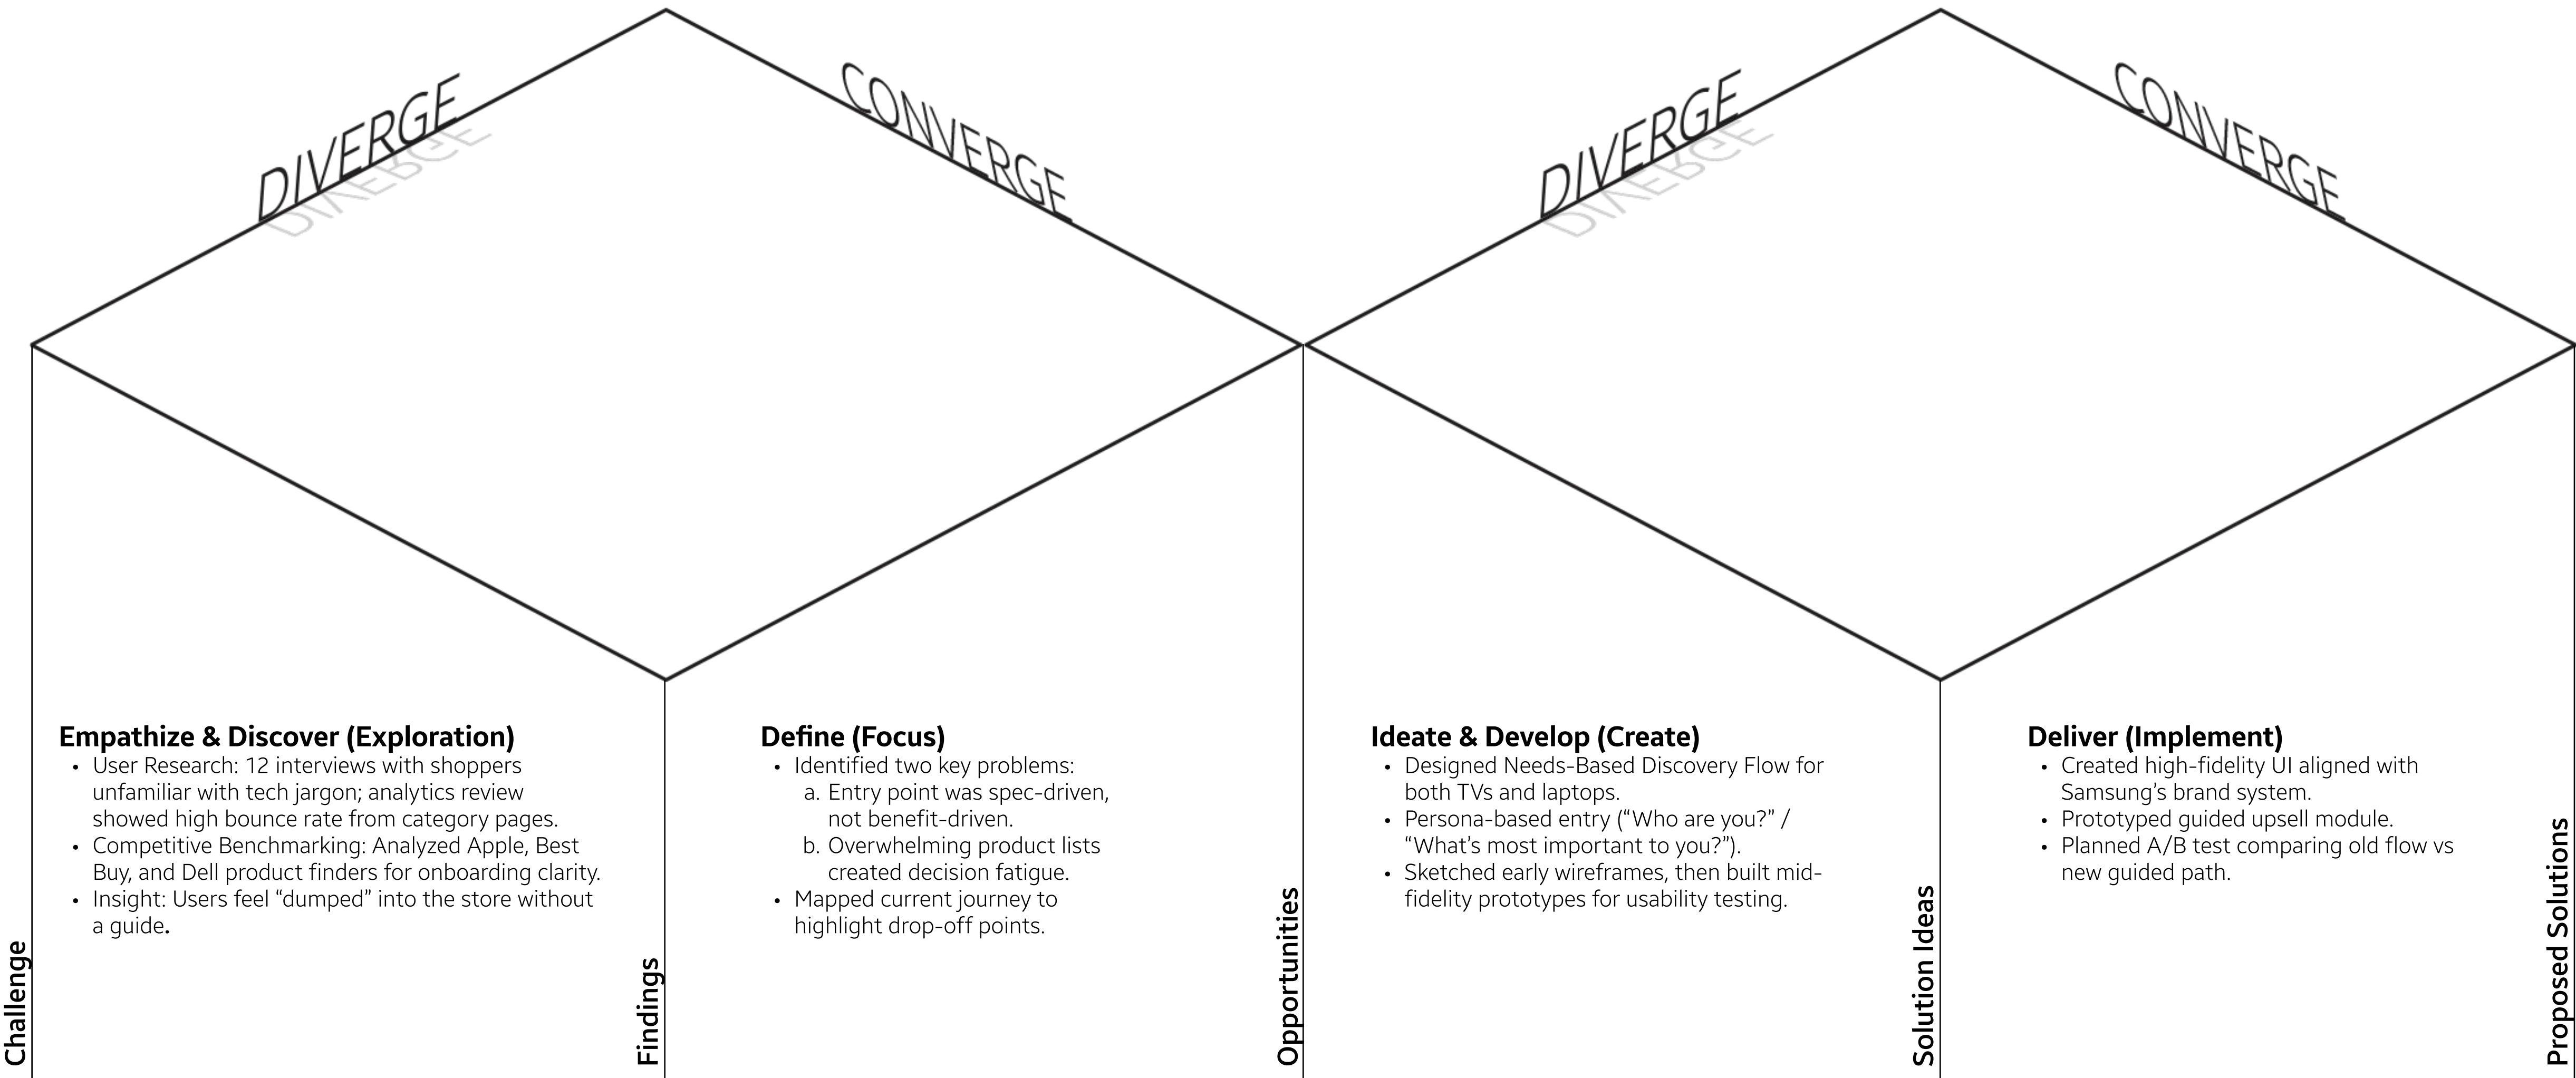

Built interactive
wireframes for TVs &
laptops.

Test

Conducted A/B testing
to validate reduced
bounce rate & higher
attach-rate potential.

Design process

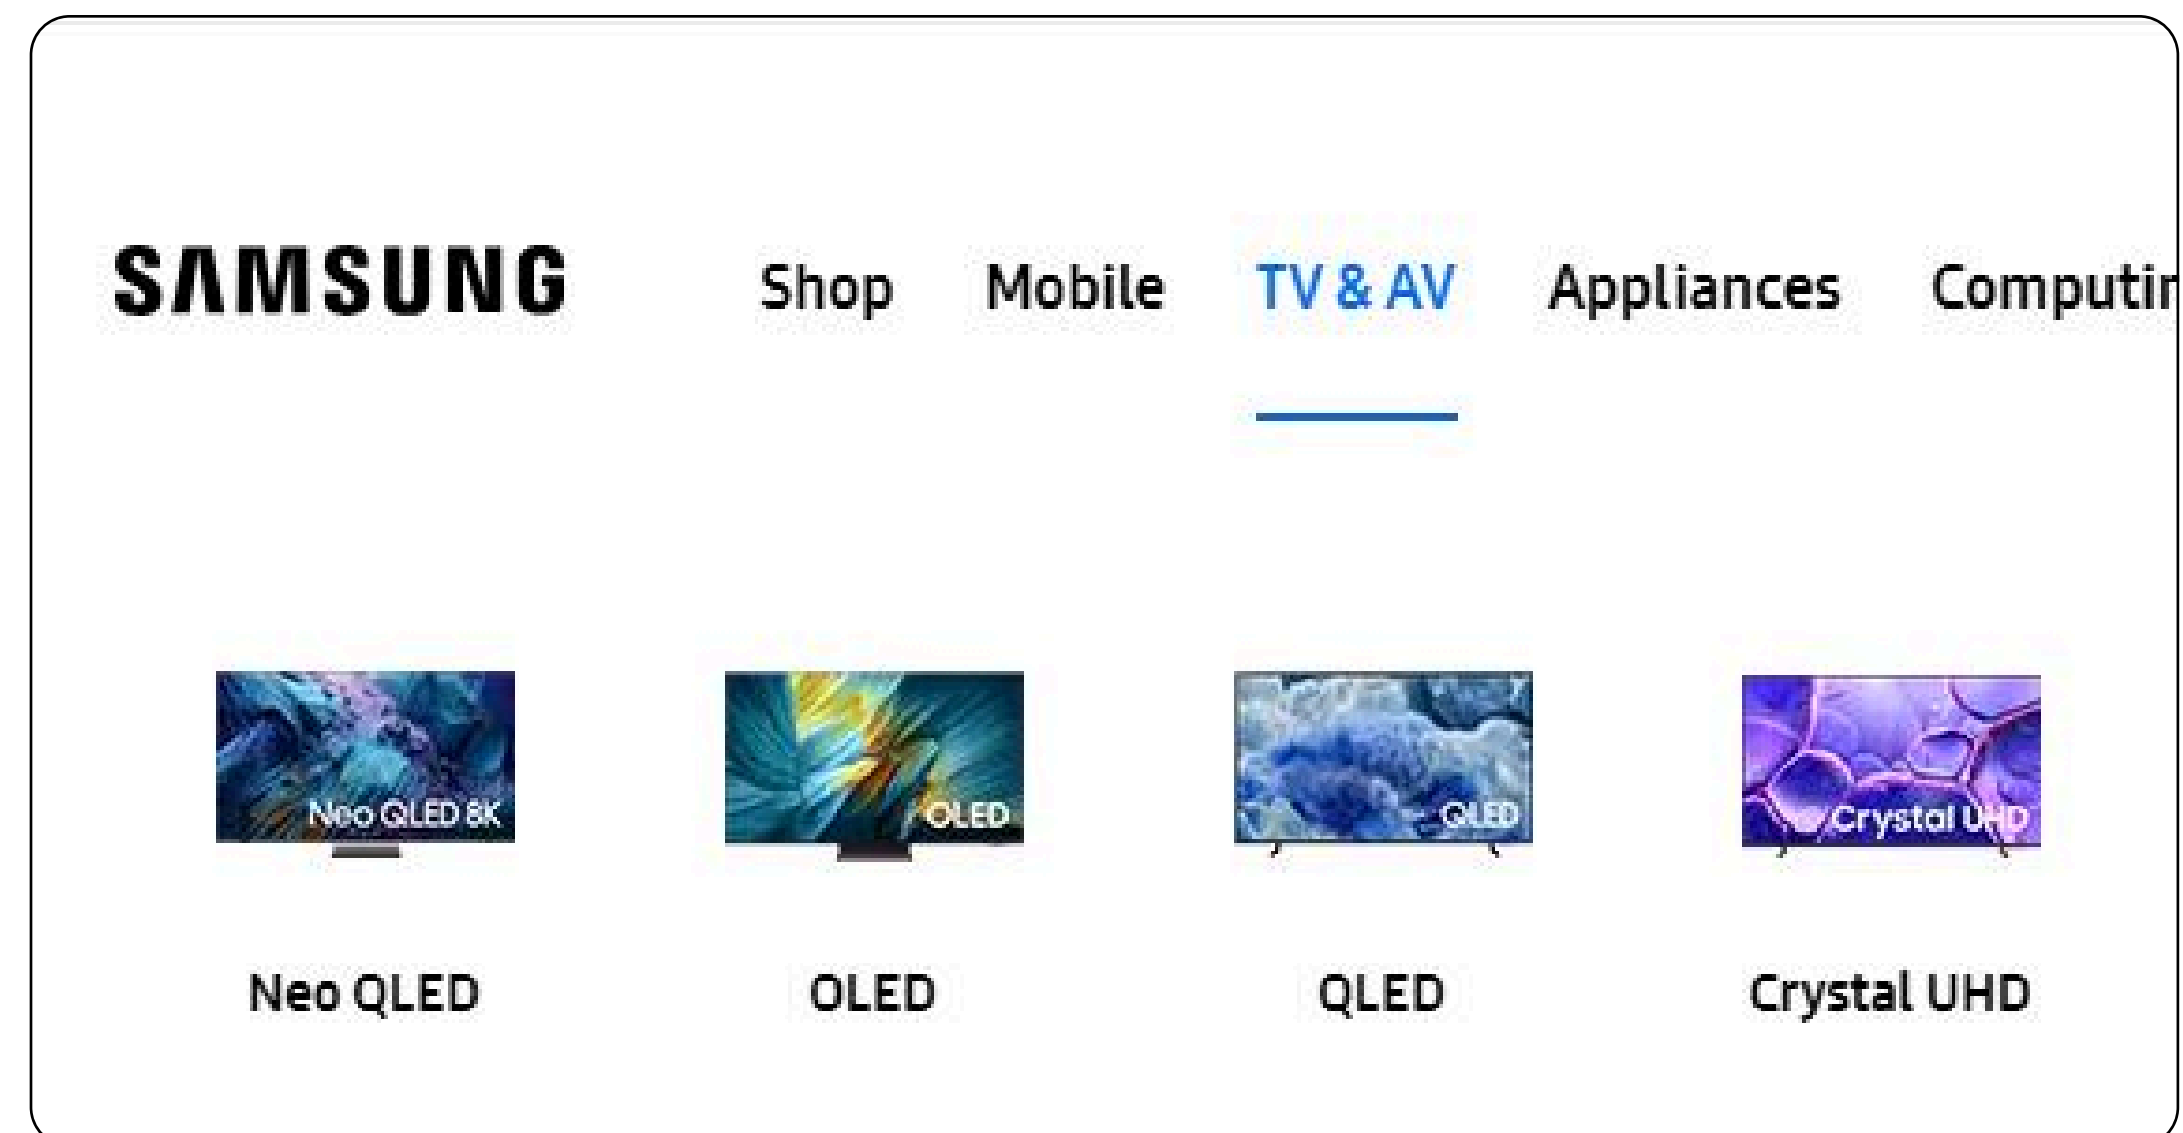

The Challenge

76% of ecommerce sites perform “mediocre to poor” on category navigation UX

75% of ecommerce sites suffer from over-categorization, hurting product findability

TV: Tech jargon upfront (OLED, QLED...)

Customers have hard time what to choose from

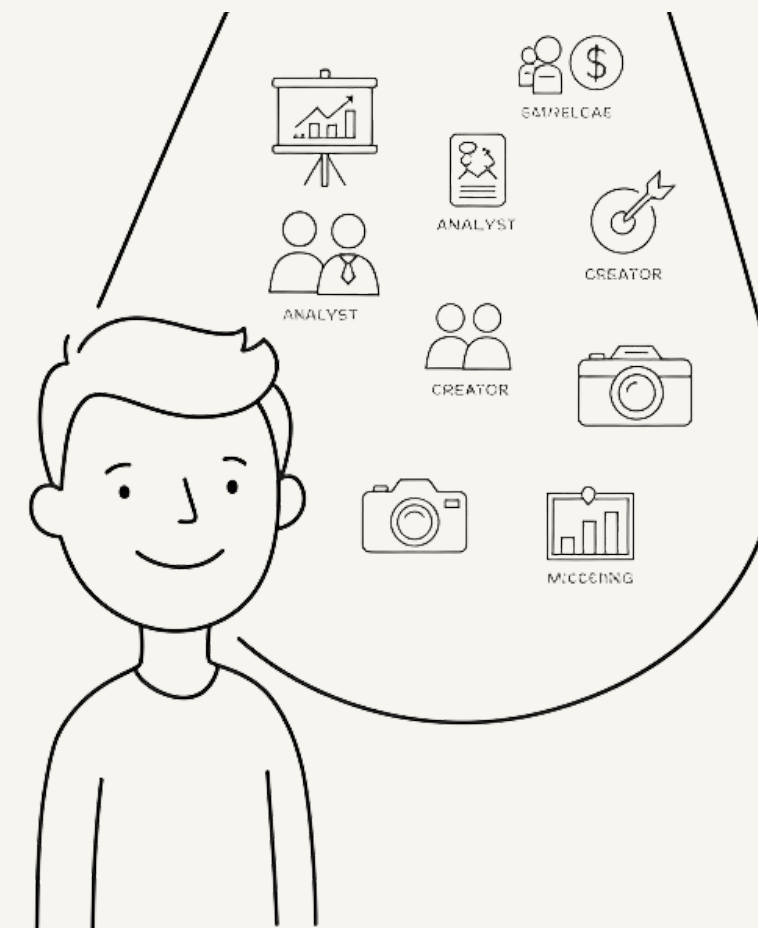

Findings

Decision Fatigue

Mediocre filtering causes 67–90% abandonment;
optimized filters cut that to ~17–33%

Persona-Based Onboarding

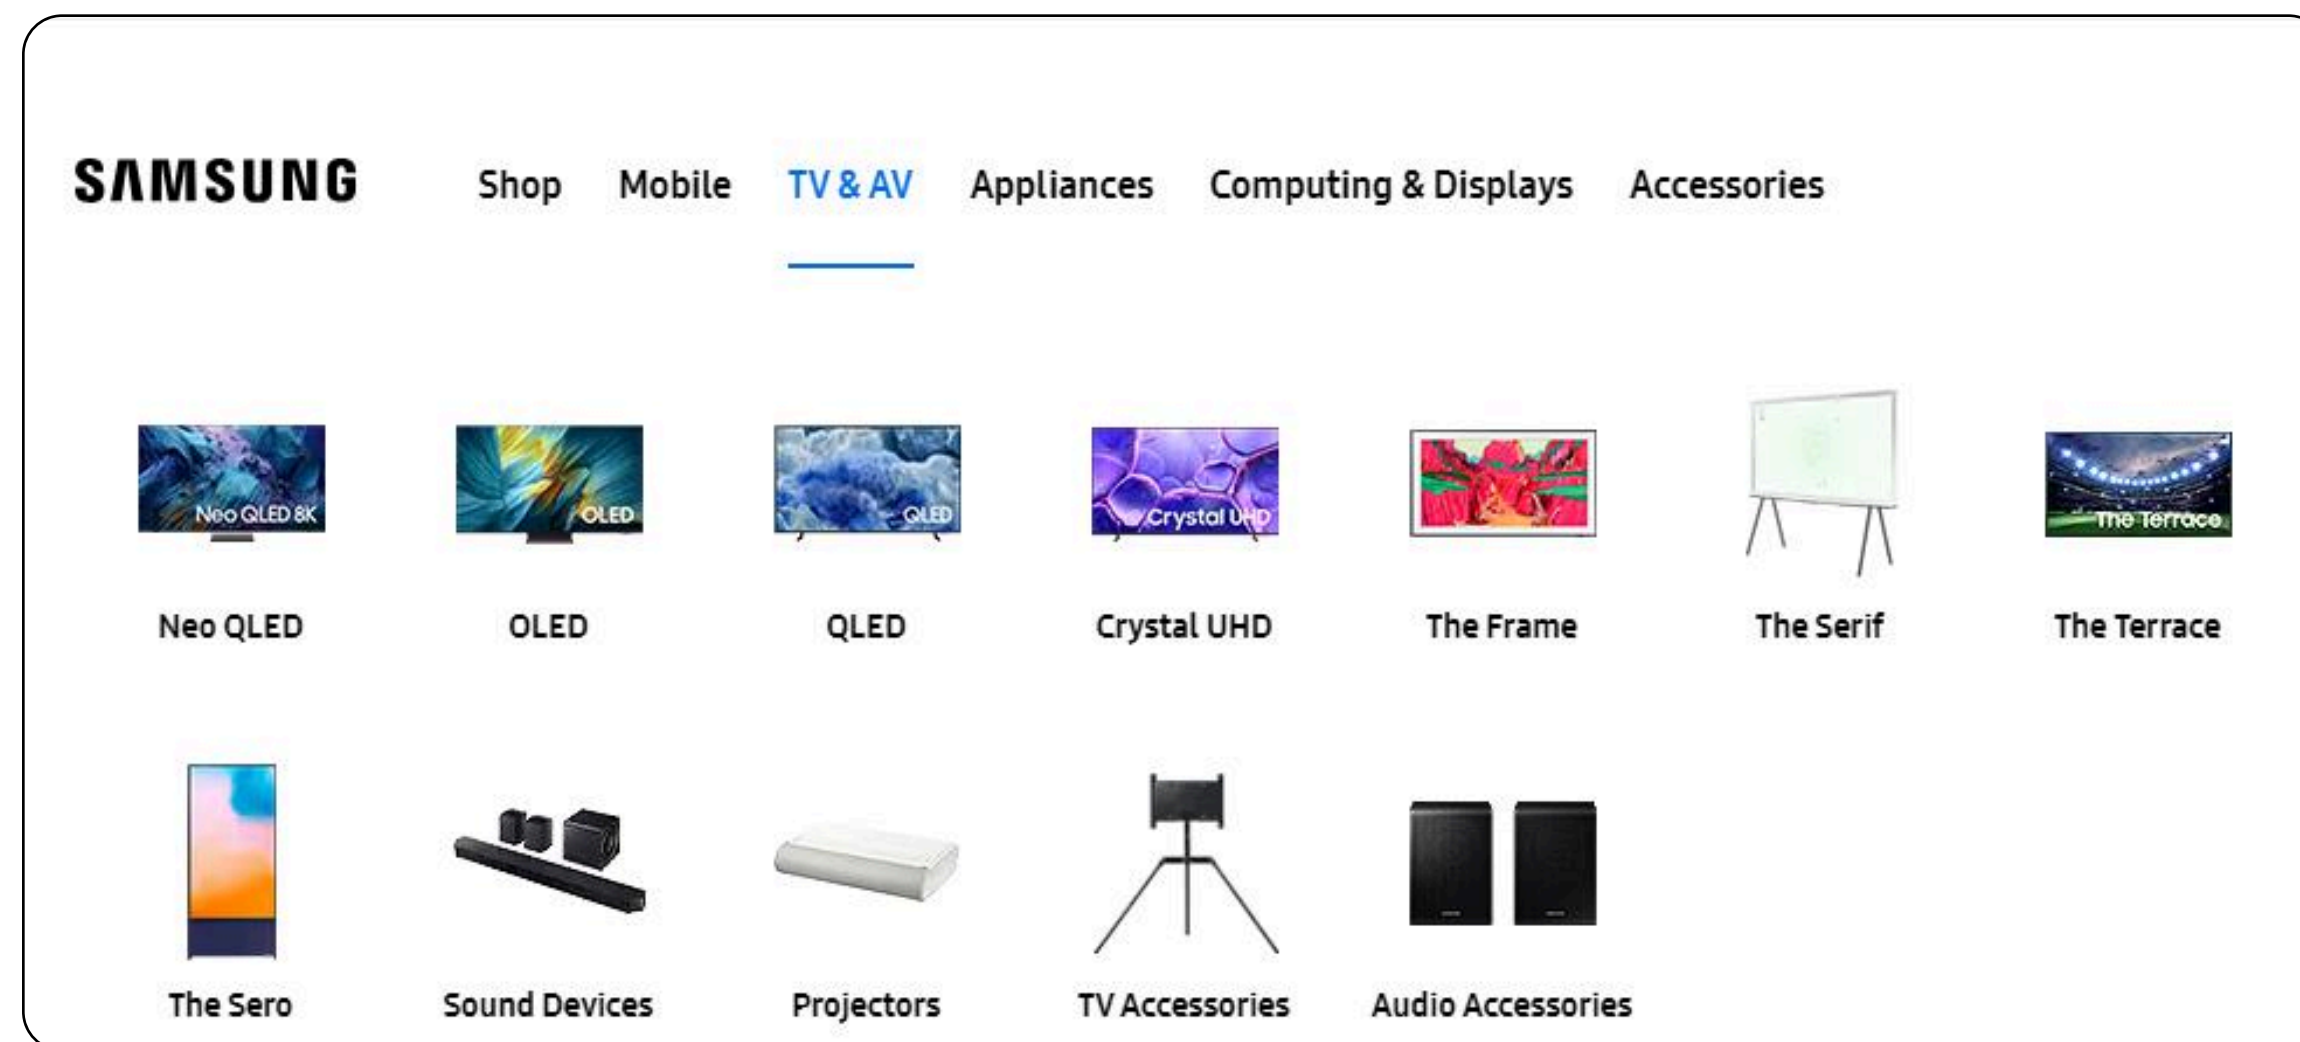

Personas improve task success and decision confidence

Cross-Sell Gap

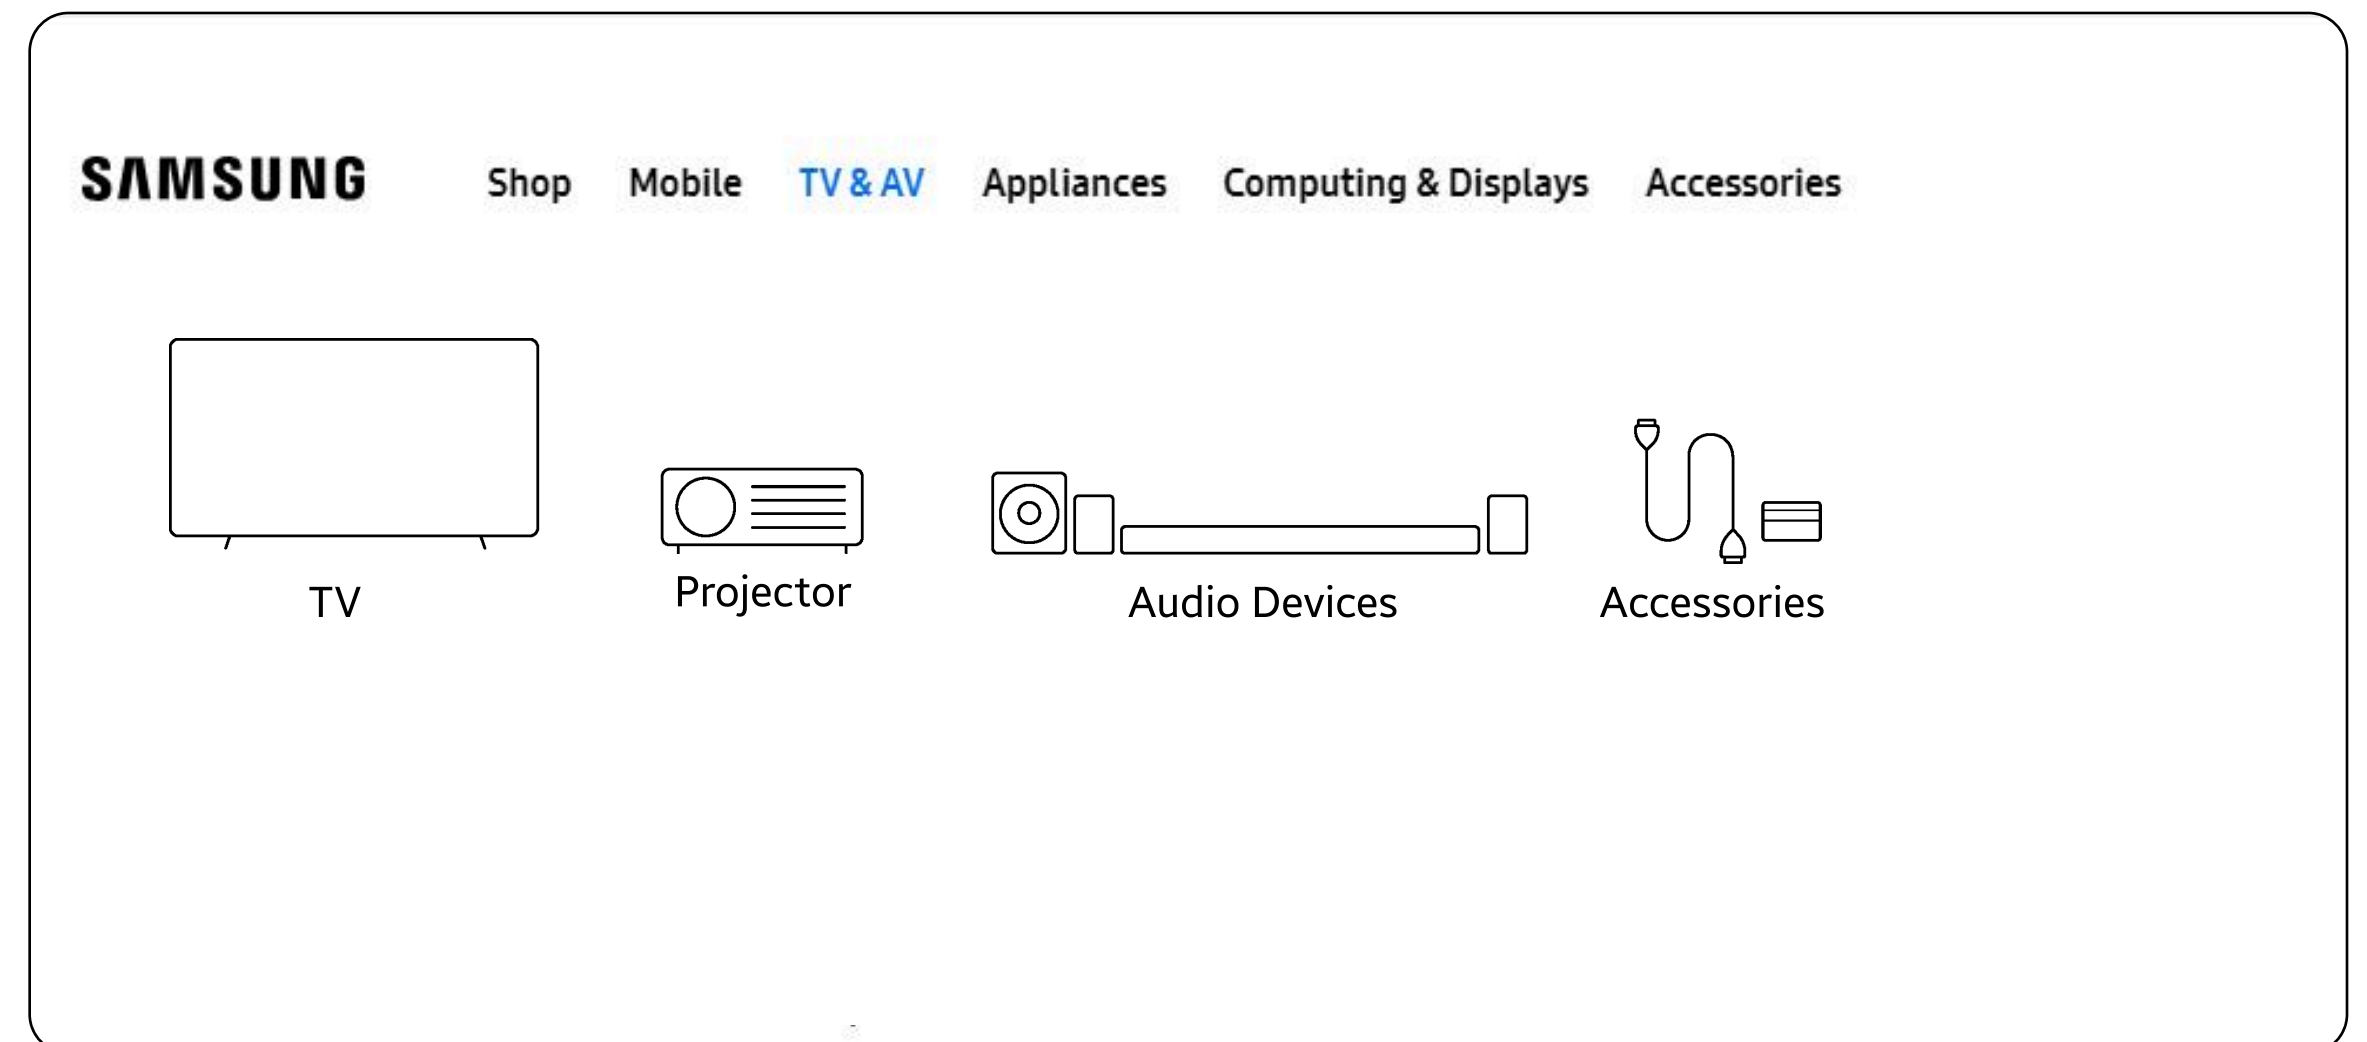

Electronics accessory attach-rates are
often under 5% without guided prompts

TV Entry Point Redesign

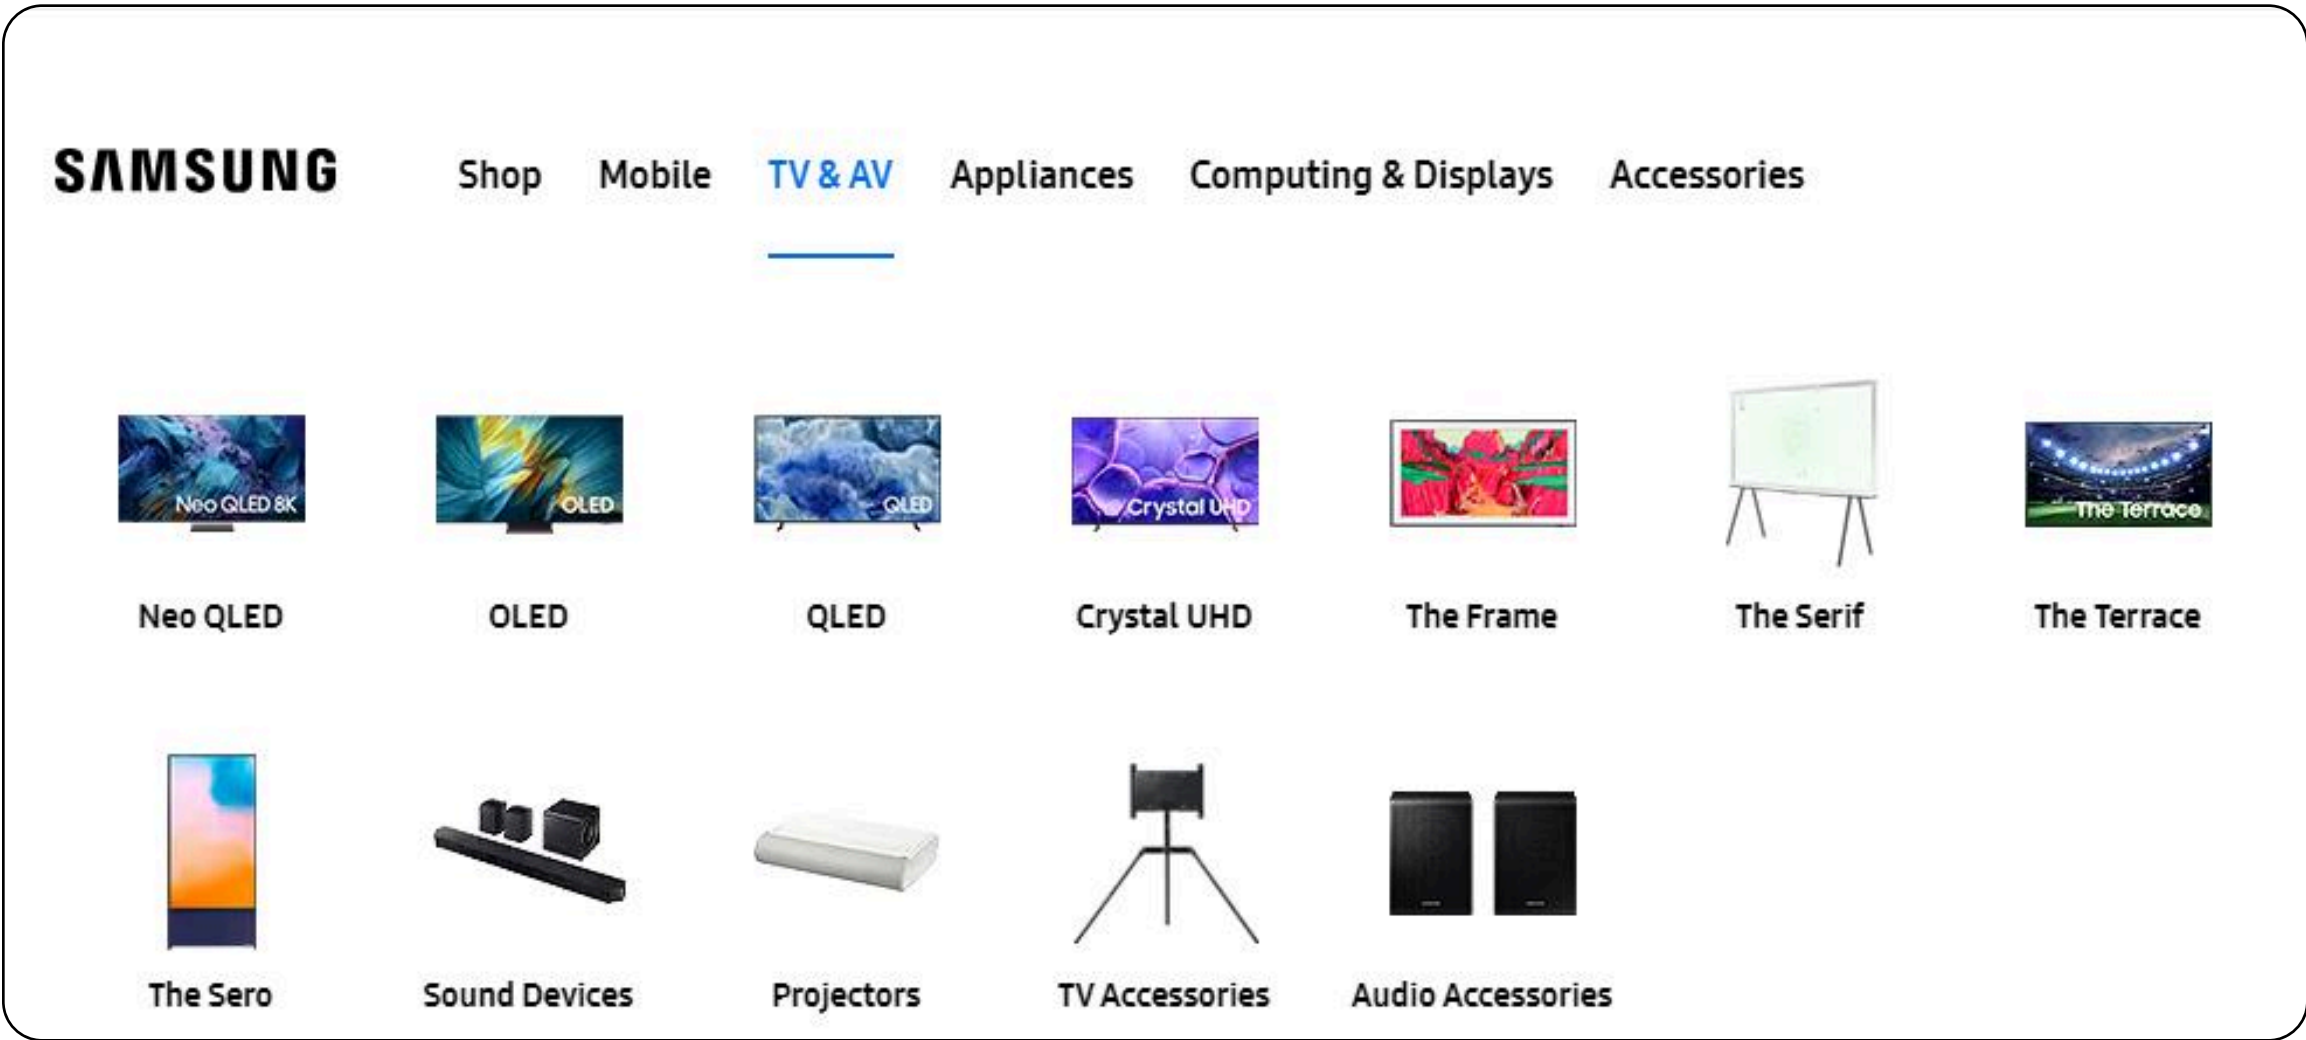

Nav categories: Too Many Categories to choose from
Complex terms and hard to know what to choose

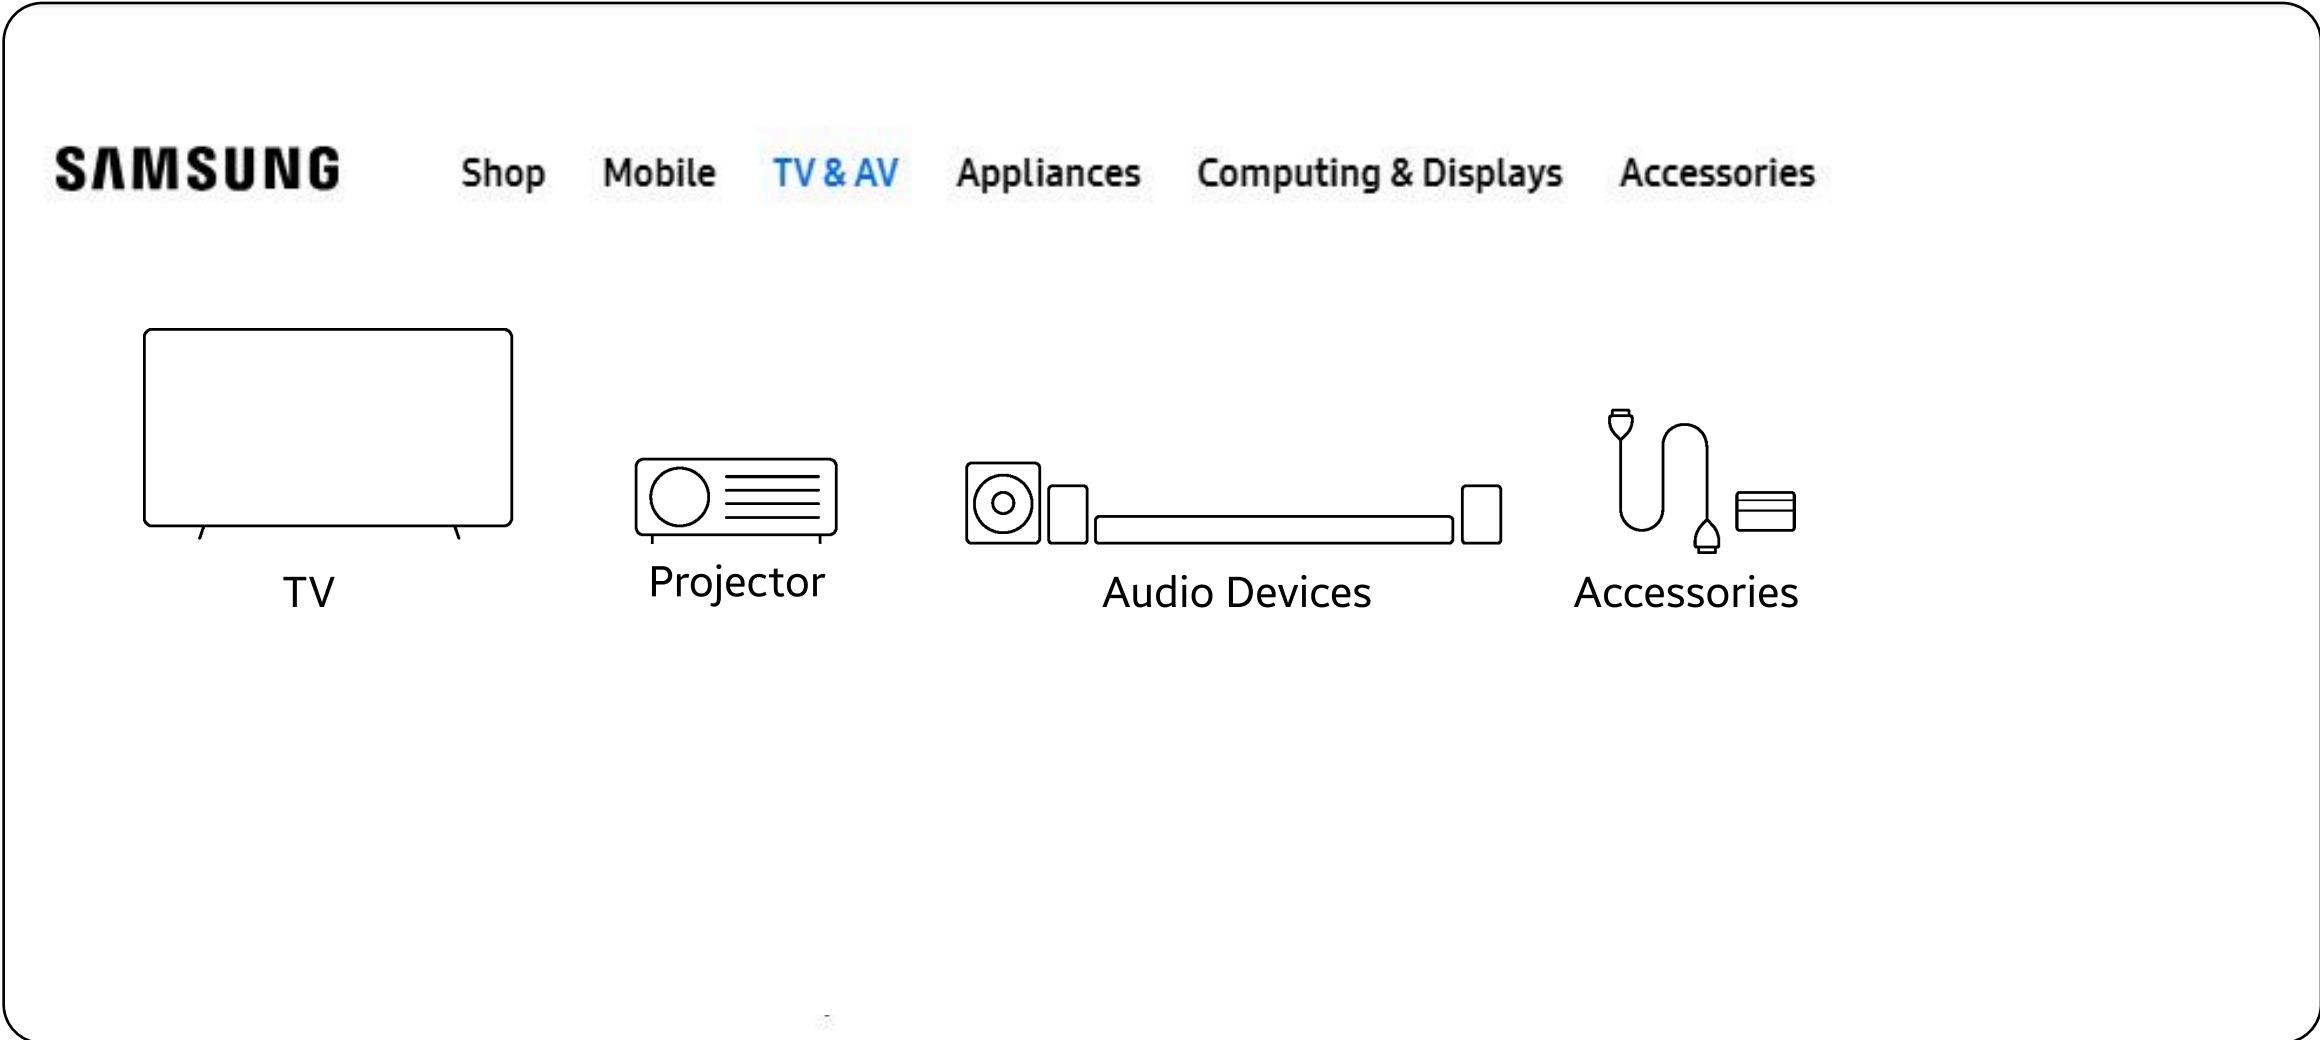

Nav categories: TVs / Audio / Projectors / Accessories
Reduces clutter and improves orientation.

A/B Testing

14%

86%

Performed A/B testing between control group and challenger group using an online survey with two different menu options.
86% have answered that the challenger menu was easier to navigate

IDEAS

Most participants expressed a preference for the challenger interface, citing improved clarity and ease of navigation, though they also identified areas for potential improvement.

- displaying the user benefits of each screen type as small, iconized sub-menus that appear on hover over the main category
- Short, silent looping clips showing the benefit in action (e.g., OLED = “Perfect blacks in a dark scene,” Neo QLED = “Vibrant colors in bright sunlight”).
- On hover, a brief 1–2 sentence benefit statement appears next to the icon.
- When a user hovers over or clicks on a benefit, a drawer slides in comparing 2–3 benefits side by side.
- On hover, the background image changes to show an example of the difference that benefit make.

Solution

Suggested Improvements from Testing

- Hover + Benefit Icons – Display small, visually distinct icons for each benefit (e.g., “Perfect Blacks” for OLED) as a sub-menu on hover.
- Quick Benefit Tooltips – Show a 1–2 sentence “Why it’s great” explanation instantly on hover.
- Scenario-Based Mini-Cards – Use contextual imagery (gaming setup, sunny living room, home theater) to connect benefits to real-life situations.
- “See the Difference” Preview – On hover, switch background imagery to demonstrate the benefit in action.
- Adaptive Recommendations – Dynamically show top matching products as users explore benefit categories.
